

## **STORAGE AND OPERATING CONDITIONS FOR HALO PRODUCTS**

### **Storage Conditions <sup>1</sup>**

Discrete transformer, choke, etc.:

-55 to +125°C @40-60%RH non-condensing

Modules with PCB assembly including Fastjacks:

-40 to +125°C @40-60%RH non-condensing

### **Operating Conditions**

Operating temperatures: Product dependent (see individual data sheet)

Operating humidity: 10-90%RH non-condensing

#### **Note**

1. Listed storage conditions will not degrade or affect mechanical and electrical integrity of the products. However, to extend leads (pins) soldering integrity prior to assembly, use of a standard storage facility for electronic components (25°C/50%RH) is recommended.
2. Seal-packed products shall remain sealed. Products that are exposed to the extreme storage conditions shall be handled with care in accordance to JEDEC J-STD-033A standard.
3. Product shelf life is defined for a minimum 18-month period from the packing bag seal date when products are stored at a standard storage facility.
4. Exceptions in storage and operating conditions are possible. Review individual data sheet for details.
